Goal:

Streamline the first-week experience by providing visual building recognition, one-tap GPS navigation, and intelligent handling of TBD/Cancelled classes that prevents "empty" map interactions.

User Stories

1. As a student, I want to see my live GPS location and get a simple walking path to my class.
13

1. Live GPS Integration: Implement the browser Geolocation API to place a "You Are Here" marker on the map to help students orient themselves relative to campus landmarks. (4)
2. One-Tap Navigation: Add a "Get Directions" button to every class pin that draws a simple walking route from the student's current GPS position to the building entrance. (8)
3. UI Focus Mode: Develop a Recenter Map button that appears only when the user is off-screen, keeping the interface uncluttered. (4)

2. As a student, I want to see what the building looks like so I can recognize it when I arrive. 8

1. Building Image Integration: Finalize the image engine to ensure building photos from the database appear in the map InfoWindow. (6)
2. Room Number Emphasis: Redesign the InfoWindow to make the Room Number the most prominent visual element once a pin is clicked. (4)
3. Dark Theme: Develop a system-wide dark mode. This includes creating a custom Google Maps JSON style for dark tiles, refactor style.css to use a complete variable-based theme

system, and implementing a toggle in script.js that persists the user's preference in localStorage. (8)

3. As a student, I want my search results to clearly distinguish between physical, online, and TBD classes so I only attempt to map reachable locations. 8

1. Smart Autocomplete: Implement a search suggestion endpoint in the Go backend to help students find courses with fewer keystrokes. (8)
2. Status-Based Blocking & Notification: Modify the search dropdown logic to identify TBD or Cancelled classes. If a student tries to add one, block the addition and trigger a UI notification/toast explaining the status. (8)
3. Online Instruction Handling: Clearly badge "Online/Remote" classes in the search results to distinguish them from TBD classes. (4)

4. As a student, I want the app to automatically display the most relevant academic terms so I can look up classes for the current or next quarter without encountering outdated info. 5

1. Date-Driven Scraper Automation: Refactor scraper.py to calculate upcoming UCSC term codes (STRM) based on the system clock rather than a hardcoded list. (6)
2. Available Terms API: Implement a Go endpoint /api/terms that queries the database for DISTINCT term and returns a sorted list to the frontend. (3)
3. Dynamic Dropdown Injection: Update script.js to fetch available terms on page load and dynamically populate the #term-select element, removing the need for manual HTML edits. (4)
4. Intelligent Term Defaulting: Implement logic to automatically pre-select the most "current" term in the dropdown based on the date, so the user doesn't have to click anything. (2)

Total Hours: 69

Team Roles

jdcody@ucsc.edu :	Developer
jlores@ucsc.edu :	Developer, Product Owner
fveloz@ucsc.edu :	Developer, Scrum Master
avalidesg@ucsc.edu :	Developer

Initial task assignment

jdcody@ucsc.edu :	User Story 4, Task 1
jlores@ucsc.edu :	User Story 1, Task 1
fveloz@ucsc.edu :	User Story 2, Task 3
avalidesg@ucsc.edu :	User Story 1, Task 3

Scrum times

TA meeting: Monday (10am-11am)

Team meeting 1: Tuesday (5pm-7pm)

Team meeting 2: Thursday (5pm-7pm)

Team meeting 3: Sunday (12pm-2pm)
