

User Story	To-Do	In Progress	Done
As a student, I want to see my entire day's walking route so I can navigate my back-to-back classes efficiently.			Chronological Schedule View: Refactor the "Saved for Later" sidebar into a daily itinerary that automatically groups and sorts saved courses by time. (6) Sequential Waypoint Logic: Research and implement the logic to handle multiple waypoints (Class A -> Class B) within a single route request. (4) Multi-path Rendering: Update the frontend map component to render continuous paths between consecutive waypoints. (4) Walk Estimates: Use the Google Routes API to calculate the time and distance for each individual route (for multiple or single meetings). (4)
As a student, I want to trust that the map data is always accurate and my usage is secure so that I never miss a class due to an outdated schedule.			Automated Data Synchronization: Implement a GitHub Action or local Cron job to trigger scraper.py every 24 hours to reflect PISA updates. (6) Backend API Proxy & Security: Move Google Maps API Keys to environment variables and implement a Go proxy endpoint to protect the application from unauthorized access. (6)
As a student, I want to export my mapped schedule to my phone's calendar so that I can view my room numbers and locations while offline.			RFC 5545 Data Schema: Define the Go structs required to generate valid iCalendar (.ics) files, including UIDs and timezone offsets. (4) iCalendar Stream Generator: Develop the Go service that marshals SQLite course records into the final .ics text stream. (4) UCSC Term Recurrence Logic: Implement logic to handle UCSC's recurring weekly patterns (MWF/TTh) and exclude holidays/finals week based on the academic calendar. (6) Frontend Export & FileStream Integration: Add the "Sync to Calendar" button and JavaScript logic to trigger the native browser file-save dialog for the .ics file. (6)
As a mobile user, I want a responsive, polished UI that persists my data reliably across sessions.			Mobile Navigation Optimization: Refactor the sidebar and search preview to ensure they are accessible and legible for one-handed use on small screens. (4) Touch Target & CSS Audit: Conduct a comprehensive audit to ensure all interactive elements meet mobile spacing standards and dark mode consistency. (4) State Hardening: Harden LocalStorage logic to ensure saved courses and visibility toggles persist across browser updates or cache clears. (5) Final Branding: Finalize custom iconography and Sammy the Slug map markers. (3)
